

## THE COUNCIL BOOK EIGHT CHAPTER 9 WOMAN IN THE MOON

“I am your Moon. I am four and a half billion years old. When asteroids destroyed your dinosaurs on planet Earth, it was a warning. The unpredictability of Nature is, actually, a definite strategy. The human species depends on the natural world for its survival. Humans are not superior to nature and animals.

You have recently acquired what you call an internet. Did you not know that trees have their own underground communications network? If you have any questions about the human brain...just ask a jellyfish or a four hundred year old shark. *Regenerate* is the word every animal uses.

Compared to trees and worms, humans don't contribute that much to the global footprint on planet Earth. The effect plants and animals have on your planet is uncontroversial. The human species is responsible for the current danger to Earth's survival. With the possibility of nuclear war, combined with the growth of artificial intelligence, you may have to consider leaving for another planet. It's time to accelerate the changes you have only just begun.

Other than humans, no animal does experiments on other animals. How humans treat others is often a clue to what they think of themselves. Courage is different than strength. “Humans won't stay with changes that they think were forced upon them. You can only change what you understand.” Many humans don't know what it feels like to love and be loved. The first time they experience these feelings is with animals.

Animals don't care what others think of them. Why do humans? Good judgement comes from experience. Experience comes from bad judgement. Listening is not agreeing. Do humans think they're the only species who thinks, feels and suffers?

Many animals have more developed senses than do humans. They understand waves and frequencies, communicate with telepathy, image, design and echolocation. Moon jellies have been on your planet for six hundred and fifty million years. Without brains, hearts, eyes, or gills, they communicate through design, something the human species doesn't yet understand.

An oyster starts out as a male and ends as a female, changing their sex every year. Sex is more than reproduction. Why is homo sapiens the only species with concern about attraction between same sex or gender? Penguins, bears, gorillas, flamingos, lizards, snakes, turtles, frogs, crabs, butterflies, spiders and owls experience same sex/gender courtships, bonding, affection and parenting. Humans are animals too. They are a very small part of the natural world.

Pre determined solutions and conventional wisdom can weigh you down. Change can be accompanied by a great deal of grief and pain. The greatest challenges humans face are climate and artificial intelligence.” The Woman in the Moon was heard around the world. Humanity immediately began to forge partnerships with nature. By doing so, many individuals experienced enchantment. Neighborhoods, cities and countries understood the urgency. Change. Hope.
